

# BLG311E Formal Languages and Automata

## Turing Machines and Introduction to Theory of Computation

A.Emre Harmancı   Tolga Ovatman   Ö.Sinan Saraç

2015

Classical automata (a.k.a. language recognizers(DFA,NFA,PDA)) sometimes is incapable of recognizing very simple language(e.g.  $a^n b^n c^n : n \geq 0$ ).

There exists more general language recognizers which perform transformation between chains of tokens. Turing machine is an example to this kind of language recognizers.

## Church-Turing Thesis

In computability theory, the Church-Turing thesis is a combined hypothesis about the nature of functions whose values are effectively calculable; or, in more modern terms, functions whose values are algorithmically computable. In simple terms, the Church-Turing thesis states that a function is algorithmically computable if and only if it is computable by a Turing machine.

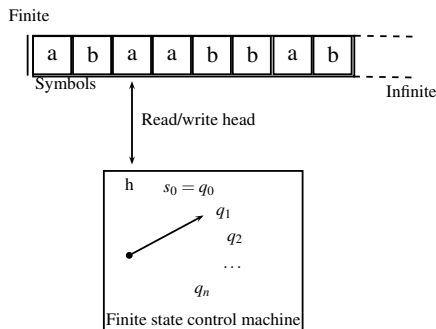

Informally the Church-Turing thesis states that if some method (algorithm) exists to carry out a calculation, then the same calculation can also be carried out by a Turing machine (as well as by a recursively definable function, and by a  $\lambda$ -function).

Classical automata (a.k.a. language recognizers(DFA,NFA,PDA)) sometimes is incapable of recognizing very simple language(e.g.  $a^n b^n c^n : n \geq 0$ ).

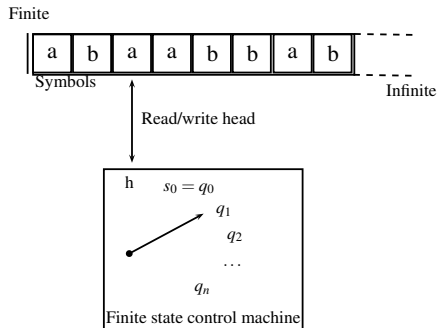

There exists more general language recognizers which perform transformation between chains of tokens. Turing machine is an example to this kind of language recognizers.

### Church-Turing Thesis

The Church-Turing thesis is a statement that characterizes the nature of computation and cannot be formally proven. Even though the three processes mentioned above proved to be equivalent, the fundamental premise behind the thesis - the notion of what it means for a function to be effectively calculable - is “a somewhat vague intuitive one”. Thus, the “thesis” remains a conjecture.

Read/write head reads the corresponding symbol on the tape and according to the state of the control machine it either writes a new symbol, or it moves left(L) or right(R). If the machine attempts to move further left from the leftmost symbol on the tape than this situation is denoted as the “machine hangs”. Head may move as much as possible towards right.

### Symbols:

- h: End of computation. Machine halts. Halt is not included in input, output and state alphabet.
- #: blank symbol
- L,R: Symbols indicating left and right movement. Those are not included in input or output alphabet.
- Input symbols are written on the leftmost side by convention.

## Formal Definition of a TM

A turing machine(TM) is a quadruple  $M = (S, \Sigma, \delta, s_0)$ , where:

- $S$ : A finite, non-empty set of states. Usually  $h \notin S$ .
- $\Sigma$ : Input/output alphabet.  $\# \in \Sigma$  but  $L, R \notin \Sigma$
- $s_0 \in S$ : An initial state, an element of  $S$ .
- $\delta$ : The state-transition function  $S \times \Sigma \rightarrow S \cup \{h\} \times (\Sigma \cup \{L, R\})$

$$q \in S \wedge a \in \Sigma \wedge \delta(q, a) = (p, b)$$

$$q \rightarrow p$$

- i) (Read) $a \rightarrow b \in \Sigma$  (write on tape, in place of  $a$ )
- ii)  $b = L$  (head left)
- iii)  $b = R$  (head right)

## Formal Definition of a TM

We can match modern computers with Turing Machines; RAM can be matched with the tape, computer programs can be matched with the state table, microprocessor(excluding I/O units) can be matched with control unit of the TM. In order to improve understandability of the state table, following notion can be used:

$q, \sigma, q', \sigma', HM$  where

- $q$  stands for current state of the machine
- $q'$  stands for the next state
- $\sigma$  stands for read symbol
- $\sigma'$  stands for symbol to be written (same with  $\sigma$  for no write)
- $HM$  stands for head move where  $HM \in -1 : L, 0 : None, 1 : R$

## Example 1

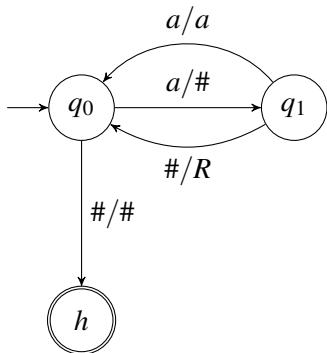

A machine that erases all the symbols from left to right.

$$S = \{q_0, q_1\}$$

$$\Sigma = \{a, \#\}$$

$$s_0 = q_0$$

| $q$   | $\sigma$ | $\delta(q, \sigma)$ |
|-------|----------|---------------------|
| $q_0$ | $a$      | $(q_1, \#)$         |
| $q_0$ | $\#$     | $(h, \#)$           |
| $q_1$ | $a$      | $(q_0, a)^1$        |
| $q_1$ | $\#$     | $(q_0, R)$          |

<sup>1</sup>: This row is to conform to the formal definition of a function

## Example 1

A machine that erases all the symbols from left to right.

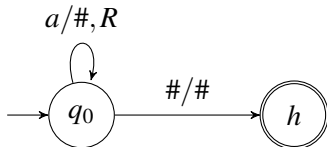

$$S = \{q_0, q_1\}$$

$$\Sigma = \{a, \#\}$$

$$s_0 = q_0$$

Now the same machine with a different notation and fewer lines

| $q$   | $\sigma$ | $\delta(q, \sigma), HM$ |
|-------|----------|-------------------------|
| $q_0$ | $a$      | $(q_0, \#), 1$          |
| $q_0$ | $\#$     | $(h, \#), 0$            |

## Example 2

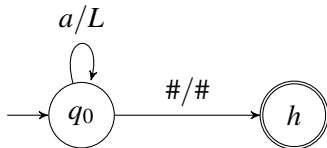

A machine that moves towards left and recognizes  $a$  symbols, halting with the first  $\#$  symbol

$$S = \{q_0\}$$

$$\Sigma = \{a, \#\}$$

$$s_0 = q_0$$

| $q$   | $\sigma$ | $\delta(q, \sigma)$ |
|-------|----------|---------------------|
| $q_0$ | $a$      | $(q_0, L)$          |
| $q_0$ | $\#$     | $(h, \#)$           |

## Configuration of a TM

A configuration is an element of the following set:

$$S \cup \{h\} \times \Sigma^* \times \Sigma \times (\Sigma^* (\Sigma - \{\#\}) \cup \{\Lambda\})$$

For instance (assume the head is on the underlined symbol):

$(q, aba, a, \underline{bab})$  or  $(q, aba, \underline{a}bab)$

$(h, \#\#, \#, \underline{\#}a)$  or  $(h, \#\#\#, \underline{\#}a)$

$(q, \Lambda, a, \underline{aba})$  or  $(q, \Lambda, \underline{a}aba)$  or  $(q, \underline{a}aba)$

$(q, \#a\#, \#, \Lambda)$  or  $(q, \#a\#, \underline{\#}\Lambda)$  or  $(q, \#a\#, \underline{\#})$

Following situation doesn't conform with configuration definition:

$(q, baa, a, bc\#)$  or  $(q, baa, \underline{a}bc\#)$

## Configuration of a TM

### Yields in one step for TM

$$(q_1, \omega_1, a_1, u_1) \vdash_M (q_2, \omega_2, a_2, u_2)$$

Here  $\delta(q_1, a_1) = (q_2, b)$  and  $b \in \Sigma \cup \{L, R\}$

- 1)  $b \in \Sigma, \omega_2 = \omega_1, u_2 = u_1, a_2 = b$  ( $a_2$  is written over  $a_1$ )
- 2)  $b = L, \omega_1 = \omega_2 a_2; (a_1 = \# \wedge u_1 = \Lambda \Rightarrow u_2 = \Lambda) \vee (a_1 \neq \# \vee u_1 \neq \Lambda \Rightarrow u_2 = a_1 u_1)$ . Left movement: If the head is on a blank and no more symbols to the right blank is erased. If the head is on a symbol or some symbols exist on the right the situation is preserved.
- 3)  $b = R, \omega_2 = \omega_1 a_1; (u_1 = a_2 u_2) \vee (u_1 = \Lambda \Rightarrow u_2 = \Lambda \wedge a_2 = \#)$ . Right movement: If there are no more symbols on the right blank is written.

## Example 3

$\omega, u \in \Sigma^*; a, b \in \Sigma$  ( $u$  cannot end with #)

$$\delta(q_1, a) = (q_2, b) \Rightarrow (q_1, \omega \underline{a} u) \vdash_M (q_2, \omega \underline{b} u)$$

$$\begin{aligned} \delta(q_1, a) = (q_2, L) \Rightarrow & i) (q_1, \omega \underline{b} \underline{a} u) \vdash_M (q_2, \omega \underline{b} \underline{a} u) \\ & ii) (q_1, \omega \underline{b} \#) \vdash_M (q_2, \omega \underline{b}) \end{aligned}$$

$$\begin{aligned} \delta(q_1, a) = (q_2, R) \Rightarrow & i) (q_1, \omega \underline{a} \underline{b} u) \vdash_M (q_2, \omega \underline{a} \underline{b} u) \\ & ii) (q_1, \omega \underline{a}) \vdash_M (q_2, \omega \underline{a} \#) \end{aligned}$$

## $n$ steps computation

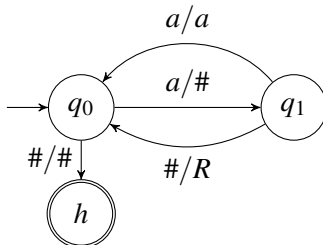

### A computation of length $n$

A computation of length  $n$  or in other words  $n$  steps computation can be defined as:

$$C_0 \vdash_M C_1 \vdash_M C_2 \vdash_M \dots C_{n-1} \vdash_M C_n$$

Example 1: A machine that erases all the symbols from left to right.

| $q$   | $\sigma$ | $\delta(q, \sigma)$ |
|-------|----------|---------------------|
| $q_0$ | $a$      | $(q_1, \#)$         |
| $q_0$ | $\#$     | $(h, \#)$           |
| $q_1$ | $a$      | $(q_0, a)$          |
| $q_1$ | $\#$     | $(q_0, R)$          |

$$\begin{aligned}
 &(q_0, \underline{aaaa}) \vdash_M (q_1, \# \underline{aaa}) \vdash_M (q_0, \# \underline{aaa}) \vdash_M (q_1, \# \# \underline{aa}) \vdash_M (q_0, \# \# \underline{aa}) \vdash_M \\
 &(q_1, \# \# \# \underline{a}) \vdash_M (q_0, \# \# \# \underline{a}) \vdash_M (q_1, \# \# \# \#) \vdash_M (q_0, \# \# \# \# \#) \vdash_M (h, \# \# \# \# \#)
 \end{aligned}$$

# Turing Computable Function

## Turing Computable Function

Turing computable functions can perform transformations over character strings.

$$M = (S, \Sigma, \delta, s_0)$$

Let's distinguish  $\Sigma_I$  as input alphabet and  $\Sigma_O$  as output alphabet;

$$f(\omega) = u \wedge \omega \in \Sigma_I^* \wedge u \in \Sigma_O^* \subseteq \Sigma^* \text{ and}$$

$$(s_0, \# \omega \#) \vdash_M^* (h, \# u \#), \# \notin \Sigma_I \wedge \# \notin \Sigma_O$$

## Example 4

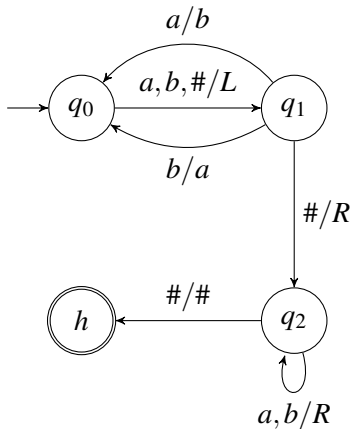

A machine that inverses strings (writes  $b$  in place of  $a$  ;  $a$  in place of  $b$ )

$$S = \{q_0, q_1, q_2\}$$

$$\Sigma = \{a, b, \#\}$$

$$s_0 = q_0$$

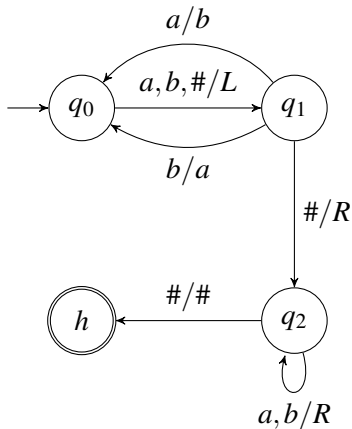

| $q$   | $\sigma$ | $\delta(q, \sigma)$ |
|-------|----------|---------------------|
| $q_0$ | $a$      | $(q_1, L)$          |
| $q_0$ | $b$      | $(q_1, L)$          |
| $q_0$ | $\#$     | $(q_1, L)$          |
| $q_1$ | $a$      | $(q_0, b)$          |
| $q_1$ | $b$      | $(q_0, a)$          |
| $q_1$ | $\#$     | $(q_2, R)$          |
| $q_2$ | $a$      | $(q_2, R)$          |
| $q_2$ | $b$      | $(q_2, R)$          |
| $q_2$ | $\#$     | $(h, \#)$           |

## Example 4

A machine that inverses strings (writes b in place of a ; a in place of b)

$$\begin{aligned}
 &(q_0, \#aab\#) \vdash_M (q_1, \#aab\underline{b}) \vdash_M \\
 &(q_0, \#aaa) \vdash_M (q_1, \#aaa) \vdash_M \\
 &(q_0, \#aba) \vdash_M (q_1, \#\underline{a}ba) \vdash_M \\
 &(q_0, \#bba) \vdash_M (q_1, \#\underline{b}ba) \vdash_M \\
 &(q_2, \#\underline{b}ba) \vdash_M (q_2, \#b\underline{b}a) \vdash_M \\
 &(q_2, \#bba) \vdash_M (q_2, \#bba\underline{\#}) \vdash_M \\
 &(h, \#bba\#)
 \end{aligned}$$

## Example 5

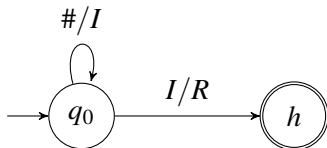

Let's represent a number  $n$  with  $n$   $I$  symbols like  $III \dots I$ . Let's build a machine that computes  $f(n) = n + 1$

$$S = \{q_0\}$$

$$\Sigma = \{I, \#\}$$

$$s_0 = q_0$$

| $q$   | $\sigma$ | $\delta(q, \sigma)$ |
|-------|----------|---------------------|
| $q_0$ | $I$      | $(h, R)$            |
| $q_0$ | $\#$     | $(q_0, I)$          |

- a)  $(q_0, \#II\#) \vdash_M (q_0, \#III) \vdash_M (h, \#III\#)$
- b)  $(q_0, \#I^n\#) \vdash_M (h, \#I^{n+1}\#)$
- c)  $(q_0, \#\#) \vdash_M (q_0, \#I) \vdash_M (h, \#I\#)$

# Turing Decidable Machine

## Turing Decidable Machine

Let  $\Sigma_0$  be our alphabet and  $\# \notin \Sigma_0$  and  $L$  be a language  $L \subseteq \Sigma_0^*$   
If we can compute the function  $x_L$  like:

$$\forall \omega \in \Sigma_0^*, F_L(\omega) = \begin{cases} \textcircled{\mathbf{Y}} \Rightarrow \omega \in L \\ \textcircled{\mathbf{N}} \Rightarrow \omega \notin L \end{cases}$$

# Turing Decidable Machine

Example:

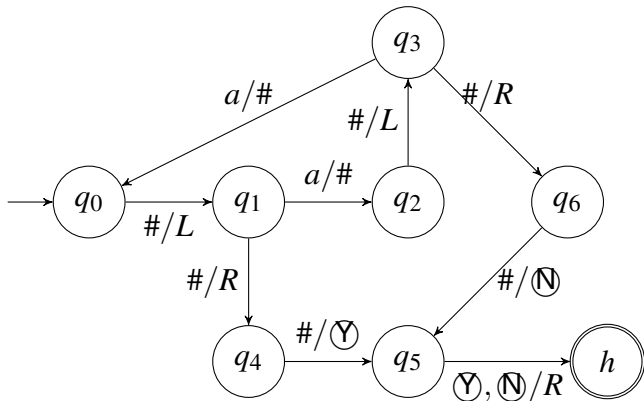

$$\Sigma_0 = \{a\}; L = \{\omega \in \Sigma_0^* \mid \|\omega\| \text{ even number}\}$$

$$S = \{q_0, \dots, q_6\}$$

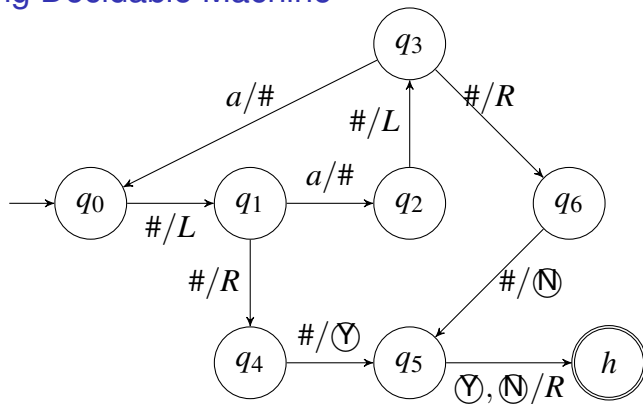

$$\Sigma = \{a, \textcircled{Y}, \textcircled{N}, \#\}$$

$$s_0 = q_0$$

| $q$   | $\sigma$          | $\delta(q, \sigma)$      |
|-------|-------------------|--------------------------|
| $q_0$ | $\#$              | $(q_1, L)$               |
| $q_1$ | $a$               | $(q_2, \#)$              |
| $q_1$ | $\#$              | $(q_4, R)$               |
| $q_2$ | $\#$              | $(q_3, L)$               |
| $q_3$ | $a$               | $(q_0, \#)$              |
| $q_3$ | $\#$              | $(q_6, R)$               |
| $q_4$ | $\#$              | $(q_5, \textcircled{Y})$ |
| $q_5$ | $\textcircled{Y}$ | $(h, R)$                 |
| $q_5$ | $\textcircled{N}$ | $(h, R)$                 |
| $q_6$ | $\#$              | $(q_5, \textcircled{N})$ |

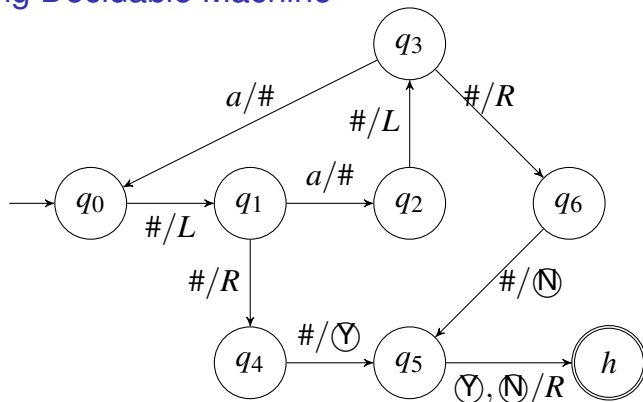

# Turing Decidable Machine

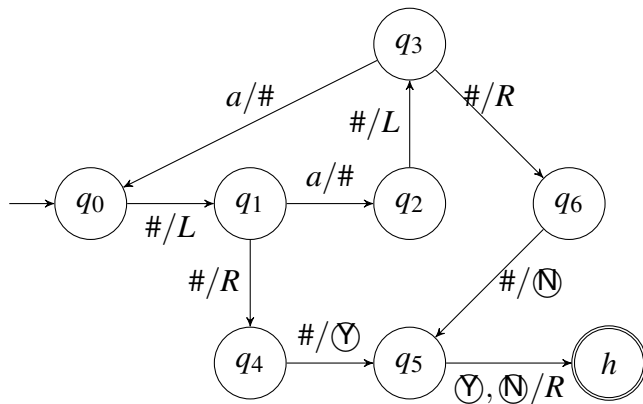

- a)  $(q_0, \#aa\#) \vdash_M (q_1, \#aa) \vdash_M (q_2, \#a\#) \vdash_M$   
 $(q_3, \#a) \vdash_M (q_0, \#\#) \vdash_M (q_1, \#) \vdash_M$   
 $(q_4, \#\#) \vdash_M (q_5, \#\underline{Y}) \vdash_M (h, \#Y\#)$

# Turing Decidable Machine

- b)  $(q_0, \#aaa\underline{\#}) \vdash_M (q_1, \#aaa\underline{a}) \vdash_M (q_2, \#aa\underline{\#}) \vdash_M$   
 $(q_3, \#aa\underline{a}) \vdash_M (q_0, \#a\underline{\#}) \vdash_M (q_1, \#\underline{a}) \vdash_M$   
 $(q_2, \#\underline{\#}) \vdash_M (q_3, \#\underline{\#}) \vdash_M (q_6, \#\underline{\#}) \vdash_M$   
 $(q_5, \#\underline{\textcircled{N}}) \vdash_M (h, \#\underline{\textcircled{N}}\underline{\#})$

# Turing Decidable Machine

a)  $(q_0, \#a^n\#) \vdash_M^* (h, \#\textcircled{Y}\#) \Rightarrow n$  is even

b)  $(q_0, \#a^n\#) \vdash_M^* (h, \#\textcircled{N}\#) \Rightarrow n$  is odd

## Some examples

$$1) \# \omega \underline{\#} \Rightarrow \# \omega \# \omega \underline{\#}$$

$$2) \# \omega \underline{\#} \Rightarrow \# \omega \omega^R \underline{\#}$$

$$3) \# \omega \omega^R \underline{\#} \Rightarrow \# \textcircled{Y} \underline{\#}$$

Let's make a demonstration run for each of these machines and try to construct a transition table.

## Some examples

1)  $\# \omega \# \Rightarrow \# \omega \# \omega \#$

Example run:

$\# \underline{a} b a \# \rightarrow \# \underline{a} b a \underline{\gamma} \rightarrow \# \underline{a} b a \underline{\gamma} \rightarrow \dots \rightarrow \# \underline{a} b a \underline{\gamma} \rightarrow \# \underline{a} b a \underline{\gamma} \rightarrow \# \underline{\alpha} b a \underline{\gamma} \rightarrow \dots \rightarrow$   
 $\# \underline{\alpha} b a \underline{\gamma} \# \rightarrow \# \underline{\alpha} b a \underline{\gamma} \underline{a} \rightarrow \dots \rightarrow$   
 $\# \underline{\alpha} b a \underline{\gamma} a \rightarrow \# \underline{a} b a \underline{\gamma} a \rightarrow \# \underline{a} b a \underline{\gamma} a \rightarrow \# \underline{a} \underline{\beta} a \underline{\gamma} a \rightarrow \dots \rightarrow$   
 $\# \underline{a} \underline{\beta} a \underline{\gamma} a \# \rightarrow \# \underline{a} \underline{\beta} a \underline{\gamma} a \underline{b} \rightarrow \dots \rightarrow$   
 $\# \underline{a} \underline{\beta} a \underline{\gamma} a \underline{b} \rightarrow \# \underline{a} \underline{b} a \underline{\gamma} a \underline{b} \rightarrow \# \underline{a} \underline{b} a \underline{\gamma} a \underline{b} \rightarrow \# \underline{a} \underline{b} a \underline{\alpha} \underline{\gamma} a \underline{b} \rightarrow \dots \rightarrow$   
 $\# \underline{a} \underline{b} a \underline{\alpha} \underline{\gamma} a \underline{b} \# \rightarrow \# \underline{a} \underline{b} a \underline{\alpha} \underline{\gamma} a \underline{b} \underline{a} \rightarrow \dots \rightarrow$   
 $\# \underline{a} \underline{b} a \underline{\alpha} \underline{\gamma} a \underline{b} a \rightarrow \# \underline{a} \underline{b} a \underline{\gamma} a \underline{b} a \rightarrow \# \underline{a} \underline{b} a \underline{\gamma} a \underline{b} a \rightarrow \# \underline{a} \underline{b} a \# \underline{a} \underline{b} a \rightarrow \dots \rightarrow \# \underline{a} \underline{b} a \# \underline{a} \underline{b} a \#$

Let's consider a special situation:

Example run:

$\# \# \rightarrow \# \underline{\gamma} \rightarrow \# \underline{\gamma} \rightarrow \# \# \rightarrow \# \# \#$

$$2) \# \omega \# \Rightarrow \# \omega \omega^R \#$$
$$\begin{aligned} & \#abb\# \rightarrow \#ab\bar{b} \rightarrow \#ab\bar{\beta} \rightarrow \#ab\beta\# \rightarrow \#ab\beta\bar{b} \rightarrow \#ab\bar{\beta}b \rightarrow \#ab\bar{b}b \rightarrow \#a\bar{b}bb \rightarrow \\ & \#a\beta\bar{b}b \rightarrow \#a\beta\bar{b}\bar{b} \rightarrow \#a\beta b\bar{b} \rightarrow \#a\beta b\bar{b}\# \rightarrow \#a\beta b\bar{b}\bar{b} \rightarrow \dots \rightarrow \\ & \#a\bar{\beta}bbb \rightarrow \#a\bar{b}bbb \rightarrow \#a\bar{b}bbb \rightarrow \\ & \#\bar{a}bbbb \rightarrow \#\alpha bbbb \rightarrow \#\alpha bbbb\# \rightarrow \#\alpha bbbb\bar{a} \rightarrow \#\alpha bbbb\bar{a} \rightarrow \dots \rightarrow \\ & \#\bar{\alpha}bbbb \rightarrow \#\bar{a}bbbb \rightarrow \#\bar{a}bbbb \rightarrow \\ & \#abbbb \rightarrow \dots \rightarrow \#abbbb \rightarrow \#ab|bba\# \end{aligned}$$

$$3)\# \omega \omega^R \# \Rightarrow \# (\Upsilon) \#$$
$$\begin{aligned} & \#abbbb\text{a}\# \rightarrow \#abbbb\text{a}\# \rightarrow \#abbbb\text{b} \rightarrow \dots \rightarrow \\ & \#abbbb \rightarrow \#abbbb \rightarrow \#\theta bbbb \rightarrow \dots \rightarrow \\ & \#\theta bbbb\# \rightarrow \#\theta bbbb\text{b} \rightarrow \#\theta bbb\text{b} \rightarrow \dots \rightarrow \\ & \#\theta bbb\text{b} \rightarrow \#\theta b\text{bb}\text{b} \rightarrow \#\theta\theta\text{bb} \rightarrow \dots \rightarrow \\ & \#\theta\theta b\text{b} \rightarrow \#\theta\theta b\text{b}\# \rightarrow \#\theta\theta b\text{b} \rightarrow \#\theta\theta\text{b} \rightarrow \#\theta\theta\text{b} \rightarrow \#\theta\theta\text{b} \rightarrow \#\theta\theta\theta^1 \rightarrow \\ & \#\theta\theta\theta \rightarrow \#\theta\theta \rightarrow \#\theta \rightarrow \# \rightarrow \#(\text{Y}) \rightarrow \#(\text{Y})\# \end{aligned}$$

27 / 30

## Some examples

$$3) \# \omega \omega^R \# \Rightarrow \# \textcircled{Y} \#$$

Example run:

$$\begin{aligned} \# \theta \theta b b \underline{b} &\rightarrow \# \theta \theta \underline{b} b \rightarrow \# \theta \theta \theta b \# \rightarrow \# \theta \theta \theta \underline{b} \rightarrow \# \theta \theta \theta \underline{\theta} \rightarrow \# \theta \theta \theta \#^2 \rightarrow \# \theta \theta \theta \# \rightarrow \\ \# \theta \theta \theta \underline{\theta} &\rightarrow \dots \rightarrow \# \theta \underline{\theta} \rightarrow \# \underline{\theta} \rightarrow \# \textcircled{N} \# \end{aligned}$$
