Derivative of a function f at a point x is defined by the equation;

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} \quad f'(x) \approx \frac{f(x+h) - f(x)}{h} \quad \text{for small } h \text{ values.}$$

- If $f(x) = x^3 + 3x^2$ and $h = 0,6$
Find approximate value of $f'(3)$
Find true value of $f'(3)$
Find true error, relative true error.

$$f'(x) \approx \frac{f(x+h) - f(x)}{h} \quad f'(x) \approx \frac{f(3+0,6) - f(3)}{0,6} \approx \frac{f(3,6) - f(3)}{0,6}$$

$$f'(x) \approx \frac{(46,656 + 38,88) - (54)}{0,6} \approx \frac{31,536}{0,6} \approx 52,56 \text{ is approximate value.}$$

$$f'(x) = 3x^2 + 6x \text{ is derivative function of function } f(x)$$

$$f'(3) = 27 + 18 = 45 \text{ is true value.}$$

$$\text{True error} = \text{true value} - \text{approximate value} = 45 - 52,56 = -7,56$$

$$\text{Relative true error} = \text{true error} / \text{true value} = -7,56 / 45 = -0,168 (\% -16,8)$$

- Compute approximate error and relative approximate error for $f'(3)$ using $h = 0,6$ and $h = 0,4$

Approximate error = present approximation – previous approximation

$$f'(x) \approx \frac{f(x+h) - f(x)}{h} \quad f'(x) \approx \frac{f(3+0,4) - f(3)}{0,4} \approx \frac{f(3,4) - f(3)}{0,4}$$

$$f'(x) \approx \frac{(39,304 + 34,68) - (54)}{0,4} \approx \frac{73,984 - 54}{0,4} \approx \frac{19,984}{0,4} \approx 49,96 \text{ is present approximation.}$$

$$\text{Approximate error} = 49,96 - 52,56 = -2,6$$

Relative approximation error = approximation error / present approximation

$$= \frac{-2,56}{49,96} = -0,051241 (\%5,1241)$$

Use Naive Gauss Elimination to solve the system of linear equations.

$$x_1 + 2x_2 + x_3 = -8$$

$$2x_1 - 2x_2 - 3x_3 = 0$$

$$-x_1 + x_2 + 2x_3 = 3$$

$$\begin{bmatrix} 1 & 2 & 1 \\ 2 & -2 & -3 \\ -1 & 1 & 2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} -8 \\ 0 \\ 3 \end{bmatrix}$$

Add -2 times row1 to row2

$$\begin{bmatrix} 1 & 2 & 1 \\ 0 & -6 & -5 \\ -1 & 1 & 2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} -8 \\ 16 \\ 3 \end{bmatrix}$$

Add -1 times row1 to row3

$$\begin{bmatrix} 1 & 2 & 1 \\ 0 & -6 & -5 \\ 0 & 3 & 3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} -8 \\ 16 \\ -5 \end{bmatrix}$$

Add (1/2) times row2 to row3

$$x_3 = 6$$

$$-6x_2 - 5 * 6 = 16$$

$$x_2 = -\frac{23}{3}$$

$$x_1 + 2x_2 + x_3 = -8$$

$$f_2(13) = 21 + 3,25(13 - 5) - 0,12(13 - 5)(13 - 9)$$

$$f_2(13) = 21 + 26 - 3,84$$

$$f_2(13) = 43,16$$
