# Communications Model

(a) General block diagram

(b) Example

A communication service enables the exchange of information between users at different locations.

Exchange of text messages via servers

A communication service enables the exchange of information between users at different locations.

## Web Browsing

Retrieval of information from web servers

A communication service enables the exchange of information between users at different locations.

## Instant Messaging

Direct exchange of text messages

A communication service enables the exchange of information between users at different locations.

## Telephone

Real-time bidirectional voice exchange

A communication service enables the exchange of information between users at different locations.

Cell phone

Real-time voice exchange with mobile users

A communication service enables the exchange of information between users at different locations.

## Short Message Service

Fast delivery of short text messages

# Why Networking??

- Point to point communication NOT usually practical
  - Devices are too far apart
  - Large set of devices would need impractical number of connections  
(have you heard of  $N^2$  problem ???)
- Solution is a *communications network*

# Communication Network

- (A set of) equipment (hardware & software) and facilities that provide the basic communication services (among computing entities)
- Virtually invisible to the user; usually represented by a cloud
- **Equipment**
  - Routers, servers, switches, multiplexers, hubs, modems, WLAN cards, cellular phones etc...
- **Facilities**
  - Copper wires, coaxial cables, optical fiber, air etc...

# Communication Network Architecture

- *Network architecture*: the plan that specifies how the network is built and operated
  - Architecture is driven by the network services
  - Overall communication process is complex
  - *Network architecture partitions overall communication process into separate functional areas called **layers** (will be seen later in detail)*

**First Message on  
the Internet  
- ever!**

© Leonard Weinrock 2009

# History of Communication Network..

What is the FIRST message ever sent on the internet??

- Was it “What hath God Wrought” (Morse 1844)?
- Or “Watson, come here. I want you.” (Bell 1876)?
- Or “This is a Giant Step for Mankind” (Armstrong 1969)?

It was simply a **LOGIN** from the UCLA computer to the SRI computer.

- We sent an “L” - did you get the “L”? YEP!
- We sent an “O” - did you get the “O”? YEP!
- We sent a “G” - did you get the “G”?

(by Leonard Kleinrock)

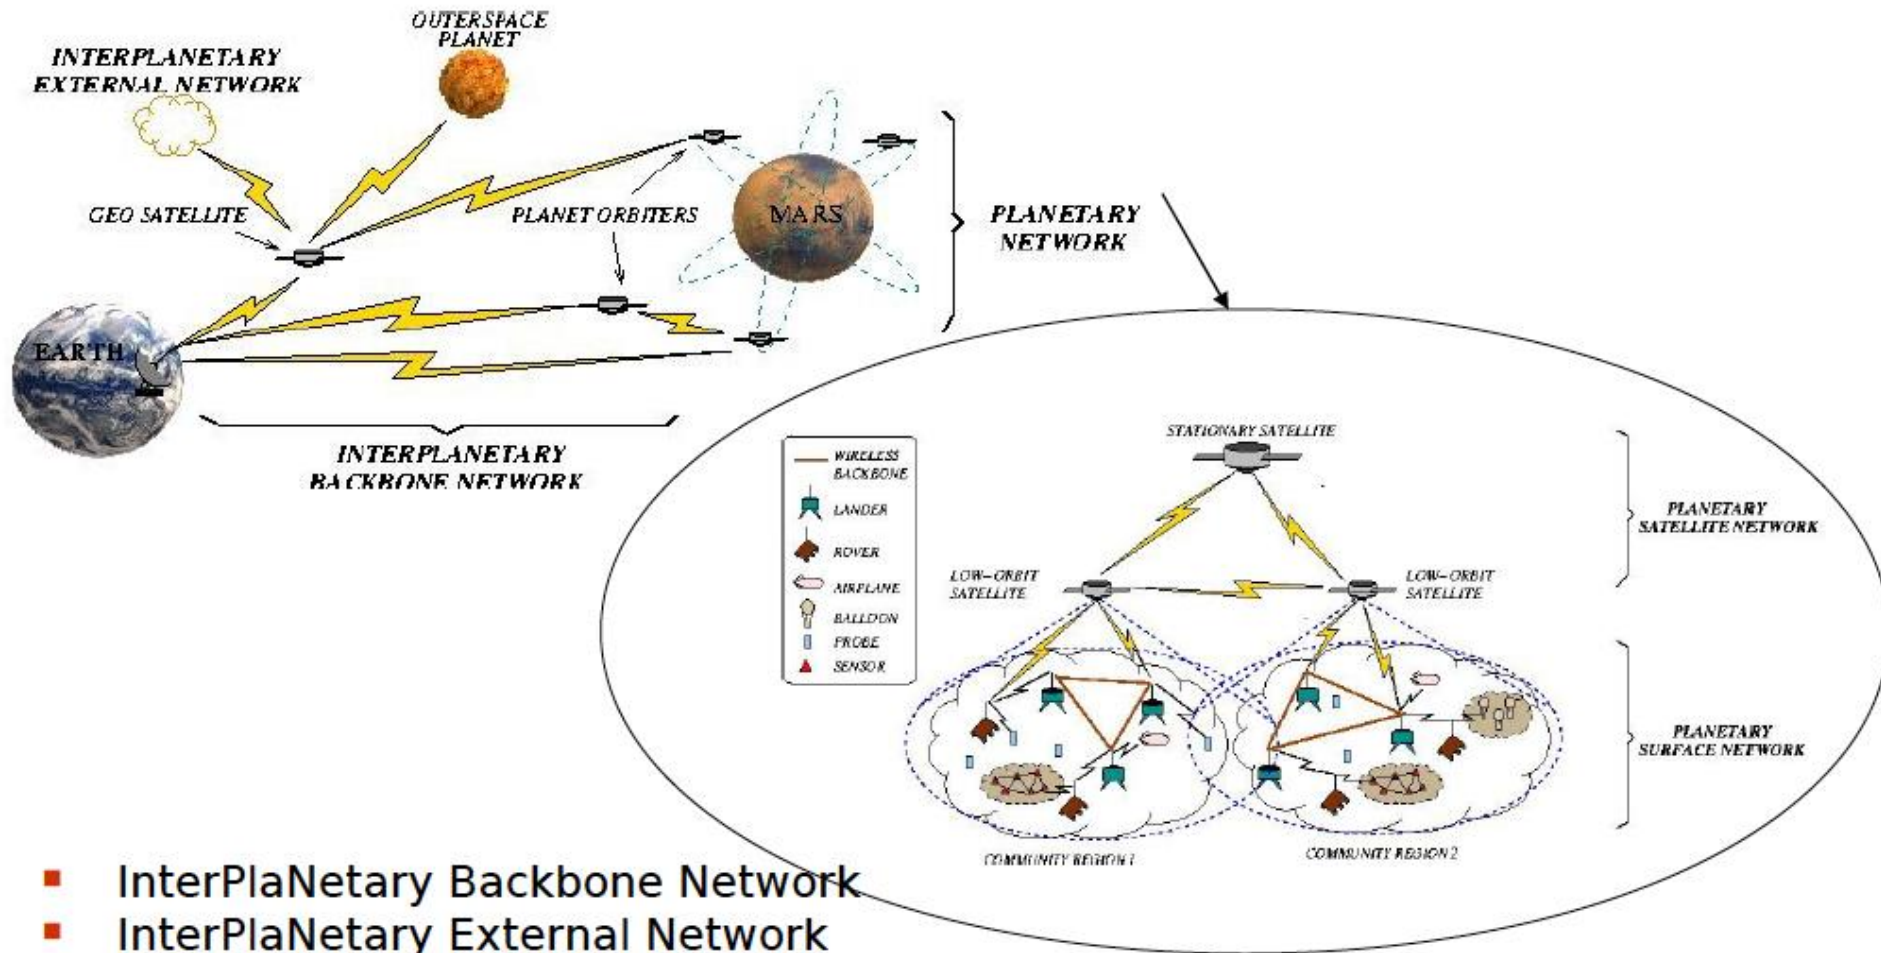

# History of Communication Network..

# And Now..

- InterPlaNetary Backbone Network
- InterPlaNetary External Network
- PlaNetary Network
  - PlaNetary Satellite Network
  - PlaNetary Surface Network

# Internet history

## *1961-1972: Early packet-switching principles*

- ❖ **1961:** Kleinrock - queueing theory shows effectiveness of packet-switching
- ❖ **1964:** Baran - packet-switching in military nets
- ❖ **1967:** ARPAnet conceived by Advanced Research Projects Agency
- ❖ **1969:** first ARPAnet node operational

### ❖ **1972:**

- ARPAnet public demo
- NCP (Network Control Protocol) first host-host protocol
- first e-mail program
- ARPAnet has 15 nodes

THE ARPA NETWORK

# Internet history

## *1972-1980: Internetworking, new and proprietary nets*

- ❖ **1970:** ALOHAnet satellite network in Hawaii
- ❖ **1974:** Cerf and Kahn - architecture for interconnecting networks
- ❖ **1976:** Ethernet at Xerox PARC
- ❖ **late70' s:** proprietary architectures: DECnet, SNA, XNA
- ❖ **late 70' s:** switching fixed length packets (ATM precursor)
- ❖ **1979:** ARPAnet has 200 nodes

### **Cerf and Kahn' s internetworking principles:**

- minimalism, autonomy - no internal changes required to interconnect networks
- best effort service model
- stateless routers
- decentralized control

**define today' s Internet  
architecture**

# Internet history

## *1980-1990: new protocols, a proliferation of networks*

- ❖ **1983:** deployment of TCP/IP
- ❖ **1982:** smtp e-mail protocol defined
- ❖ **1983:** DNS defined for name-to-IP-address translation
- ❖ **1985:** ftp protocol defined
- ❖ **1988:** TCP congestion control
- ❖ new national networks: Cset, BITnet, NSFnet, Minitel
- ❖ 100,000 hosts connected to confederation of networks

# Internet history

## *1990, 2000 's: commercialization, the Web, new apps*

- ❖ early 1990' s: ARPAnet decommissioned
- ❖ 1991: NSF lifts restrictions on commercial use of NSFnet (decommissioned, 1995)
- ❖ early 1990s: Web
  - hypertext [Bush 1945, Nelson 1960' s]
  - HTML, HTTP: Berners-Lee
  - 1994: Mosaic, later Netscape
  - late 1990' s: commercialization of the Web

### late 1990' s – 2000' s:

- ❖ more killer apps: instant messaging, P2P file sharing
- ❖ network security to forefront
- ❖ est. 50 million host, 100 million+ users
- ❖ backbone links running at Gbps

# Internet history

## *2005-present*

- ❖ ~750 million hosts
  - Smartphones and tablets
- ❖ Aggressive deployment of broadband access
- ❖ Increasing ubiquity of high-speed wireless access
- ❖ Emergence of online social networks:
  - Facebook: soon one billion users
- ❖ Service providers (Google, Microsoft) create their own networks
  - Bypass Internet, providing “instantaneous” access to search, email, etc.
- ❖ E-commerce, universities, enterprises running their services in “cloud” (eg, Amazon EC2)

# Communications Model

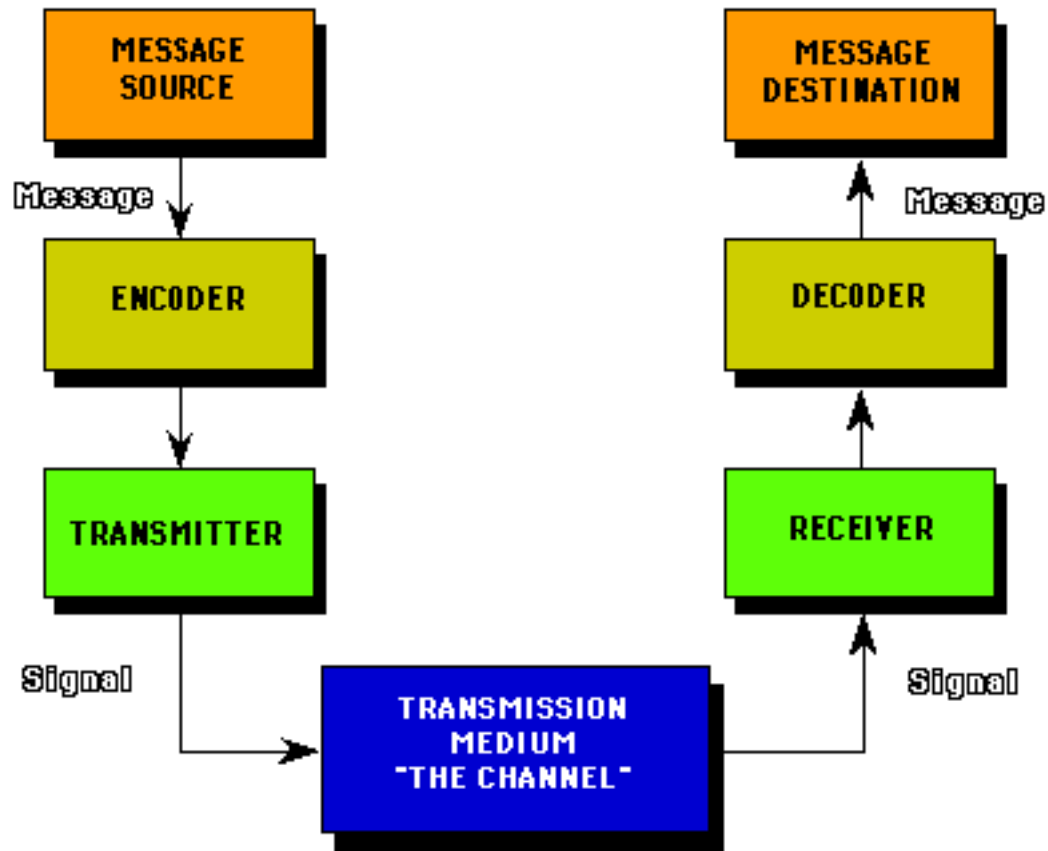

(a) General block diagram

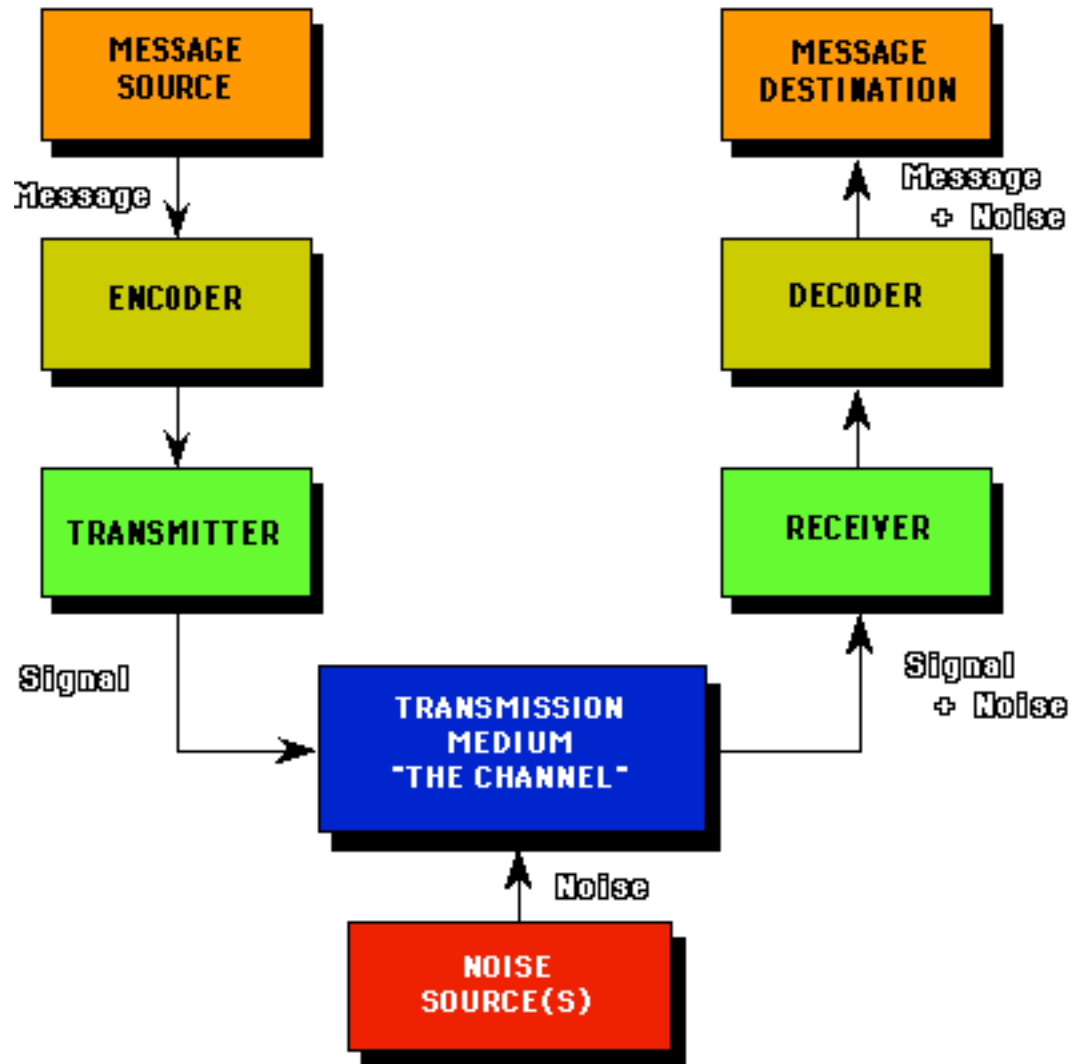

(b) Example

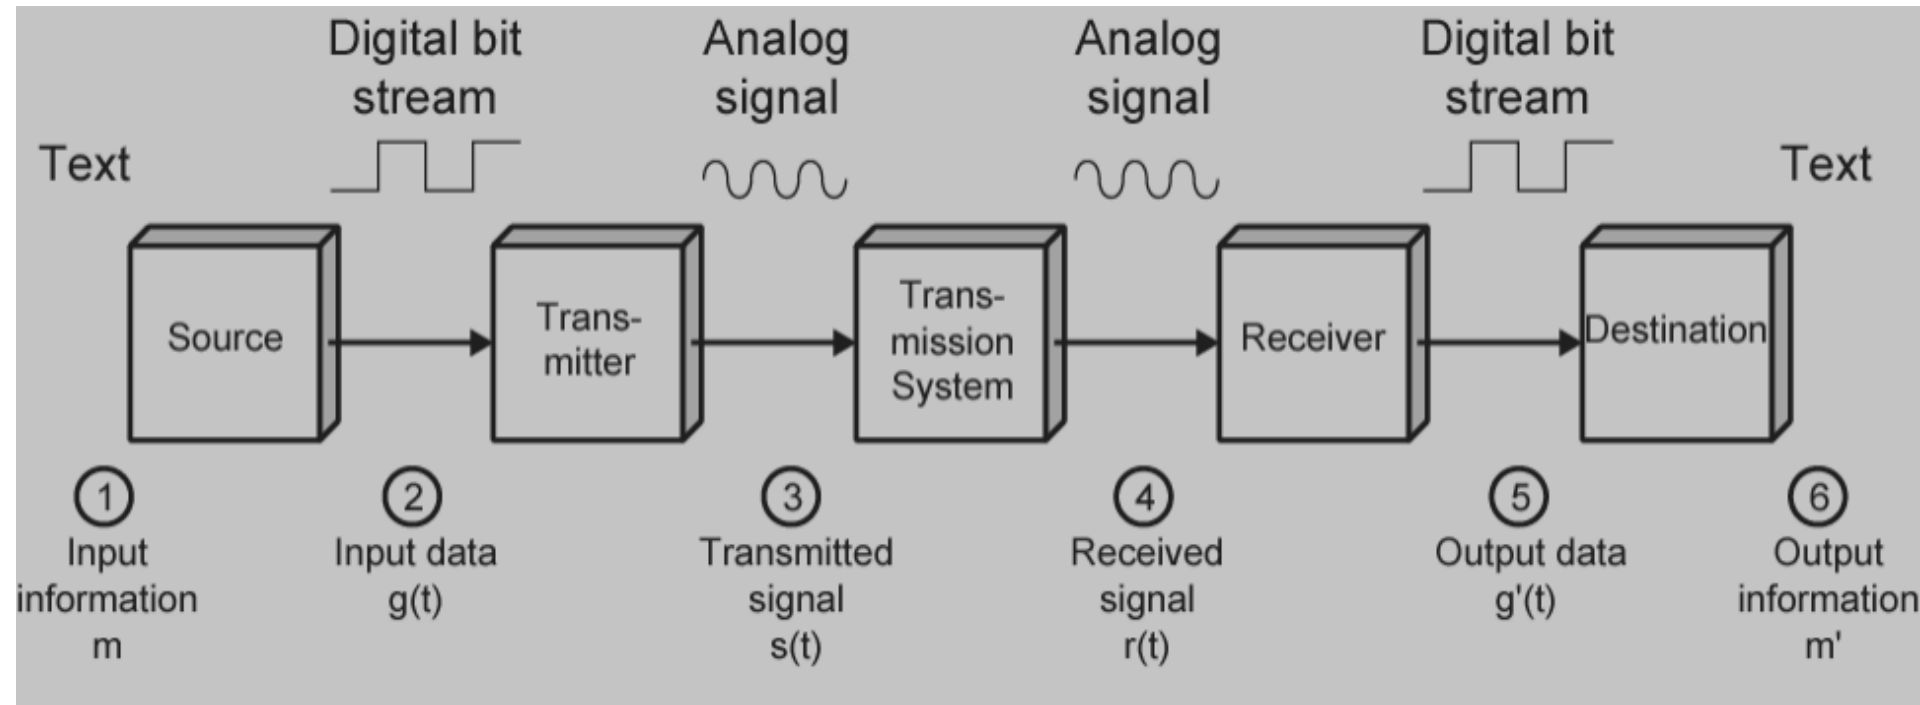

# Shannon Communication Model

# Shannon Communication Model

# Data Communications Model

# What's a protocol?

## *human protocols:*

- ❖ “what's the time?”
  - ❖ “I have a question”
  - ❖ introductions
- ... specific msgs sent
- ... specific actions taken  
when msgs received, or  
other events

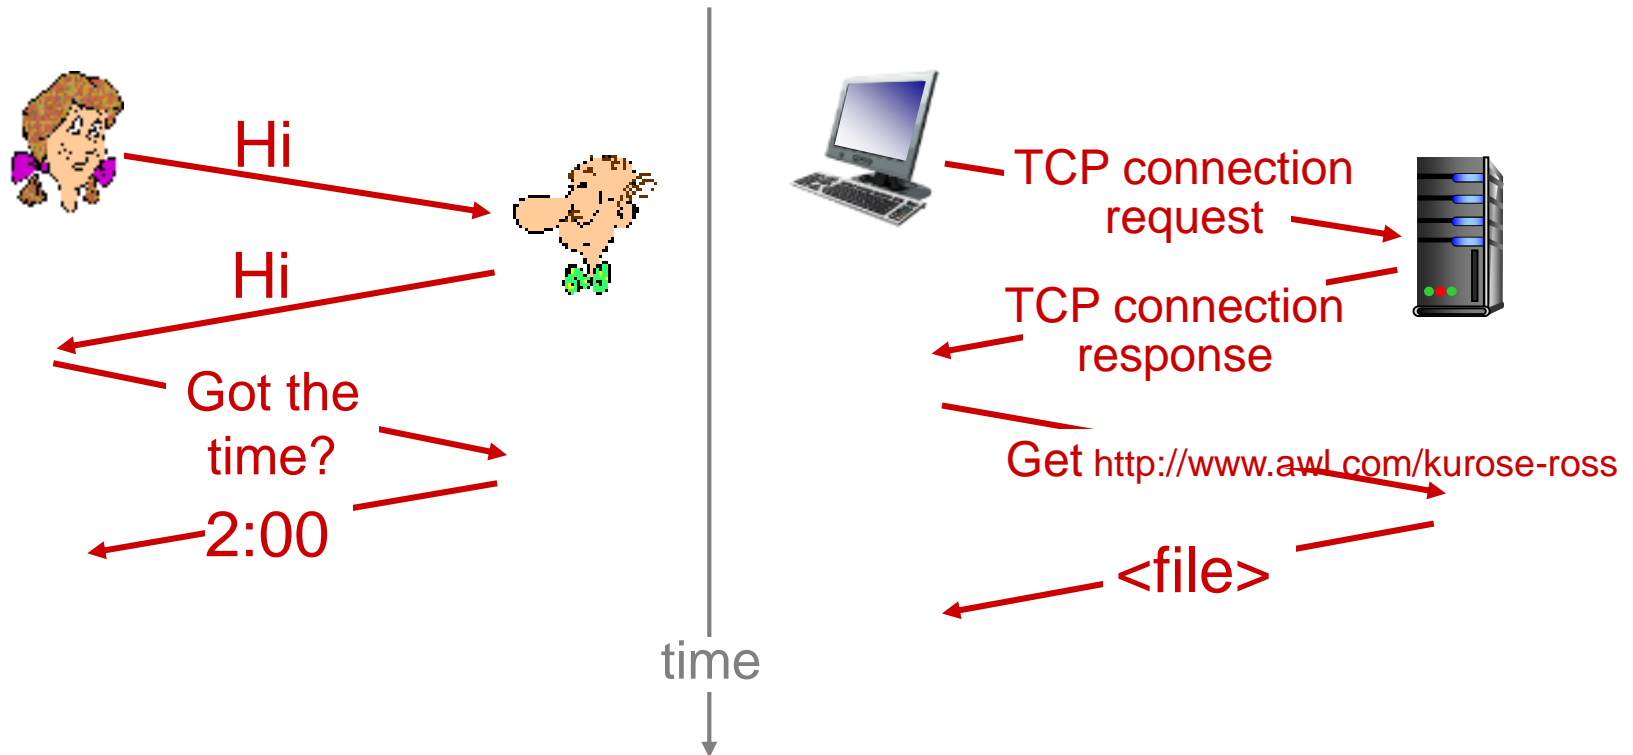

## *network protocols:*

- ❖ machines rather than humans
- ❖ all communication activity in Internet governed by protocols

*protocols define format, order of msgs sent and received among network entities, and actions taken on msg transmission, receipt*

# What's a protocol?

a human protocol and a computer network protocol:

**Q:** other human protocols?

# Protocol “layers”

*Networks are complex,  
with many “pieces”:*

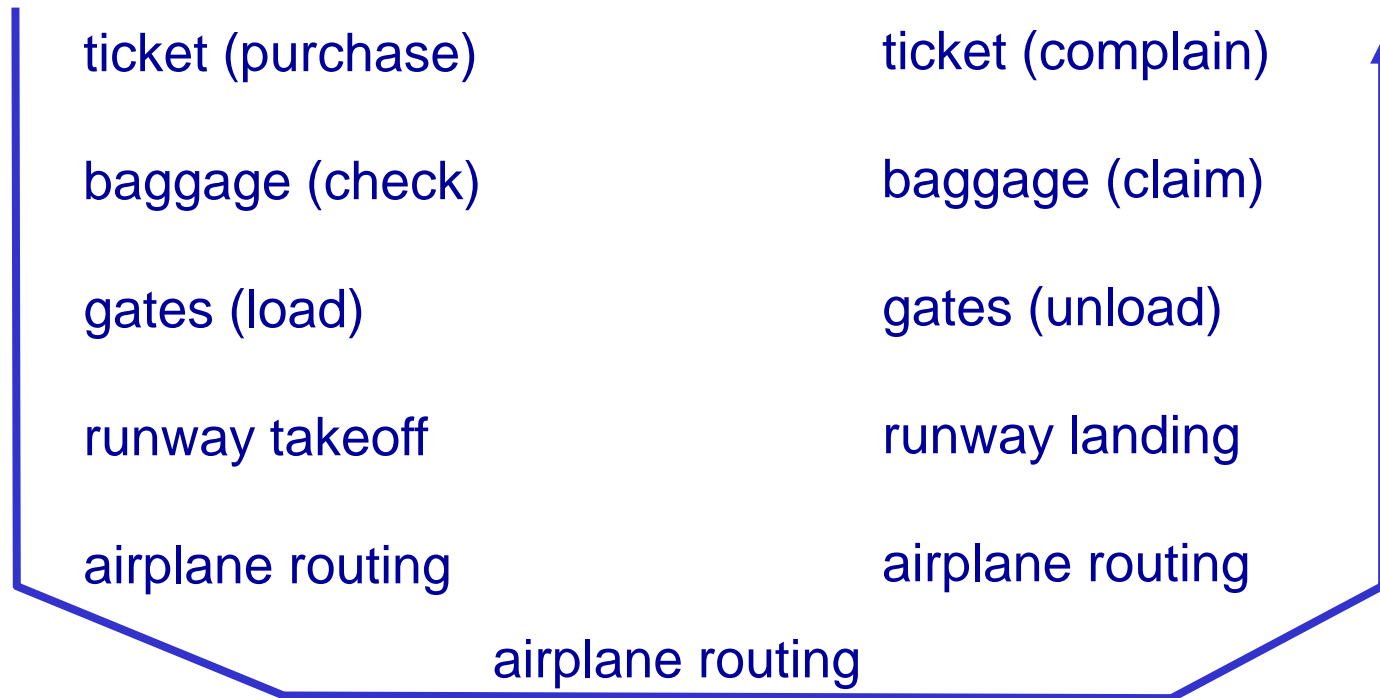

- hosts
- routers
- links of various media
- applications
- protocols
- hardware, software

*Question:*

is there any hope of  
*organizing* structure of  
network?

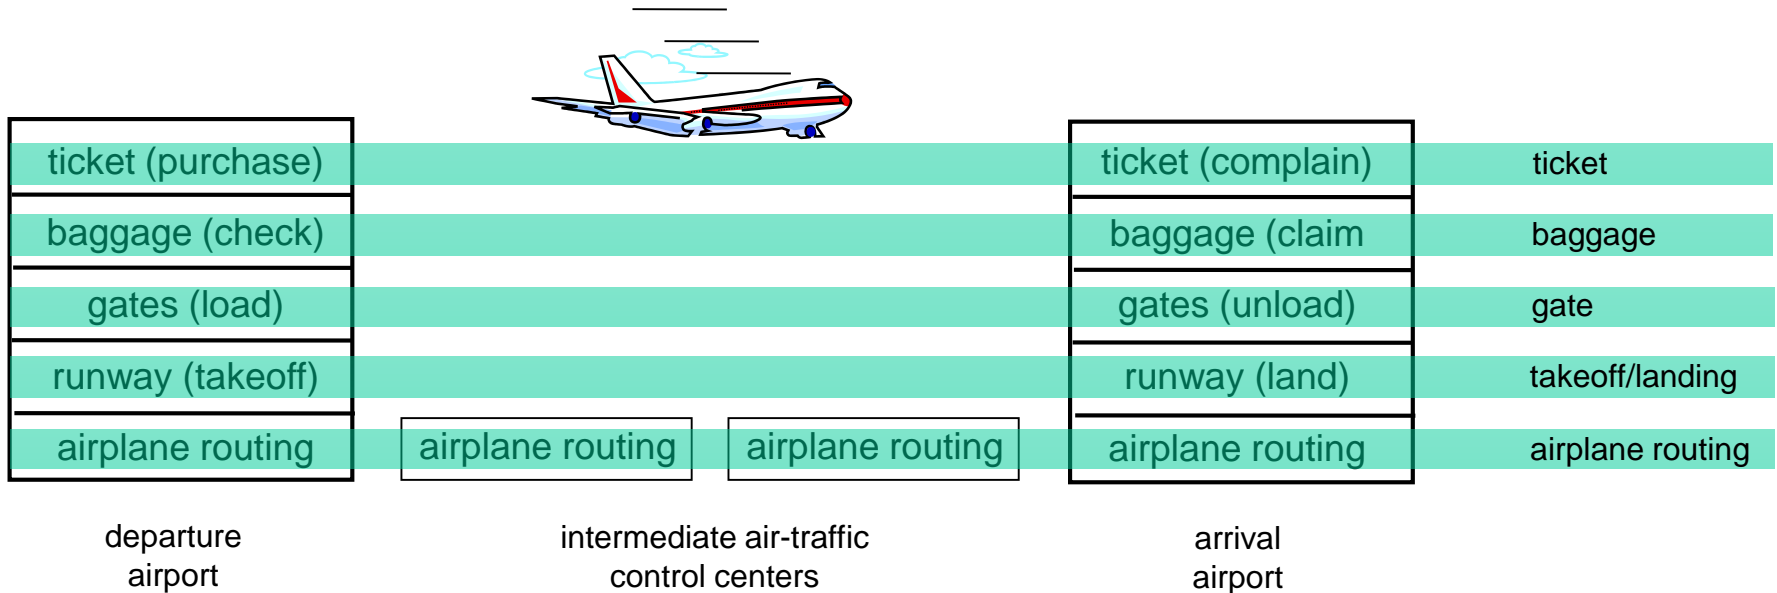

.... or at least our  
discussion of networks?

# Organization of air travel

❖ a series of steps

# Layering of airline functionality

**layers:** each layer implements a service

- via its own internal-layer actions
- relying on services provided by layer below

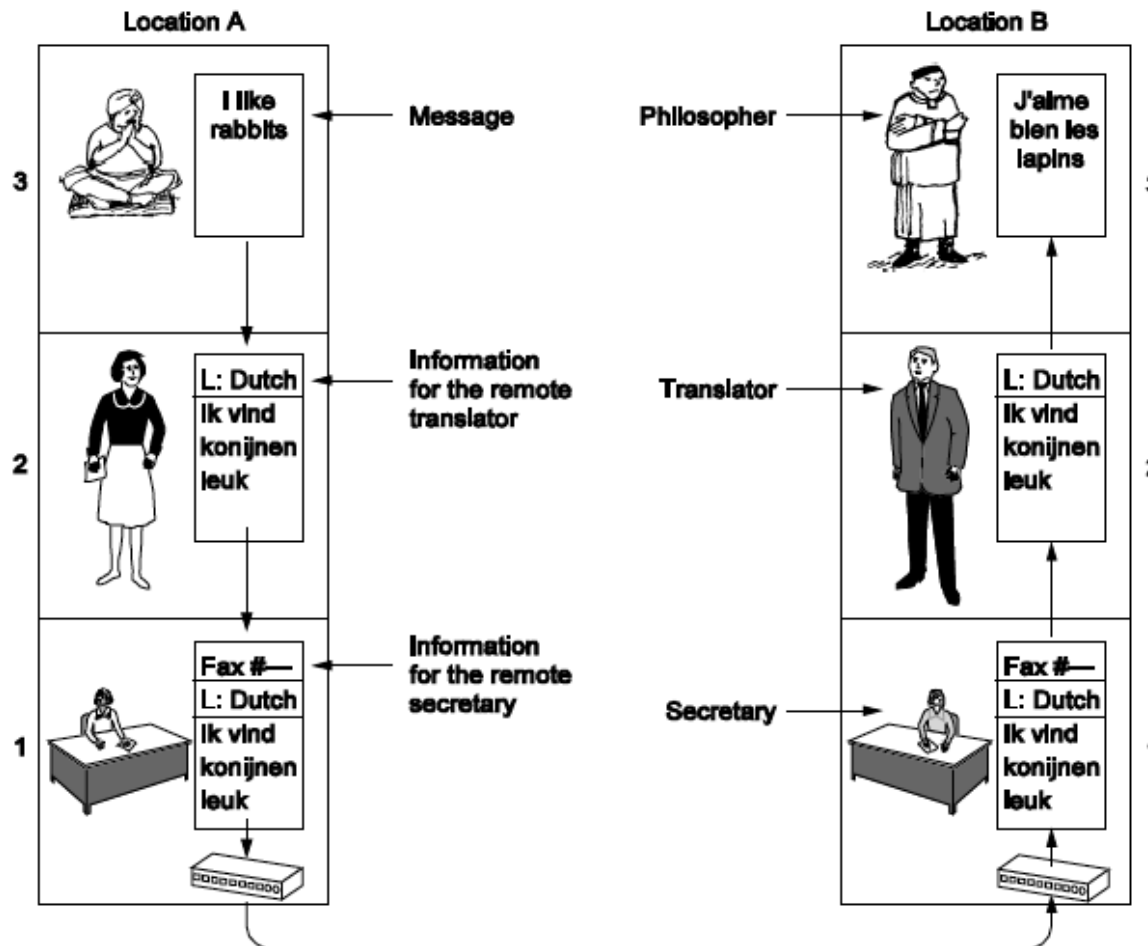

# Why layering?

dealing with complex systems:

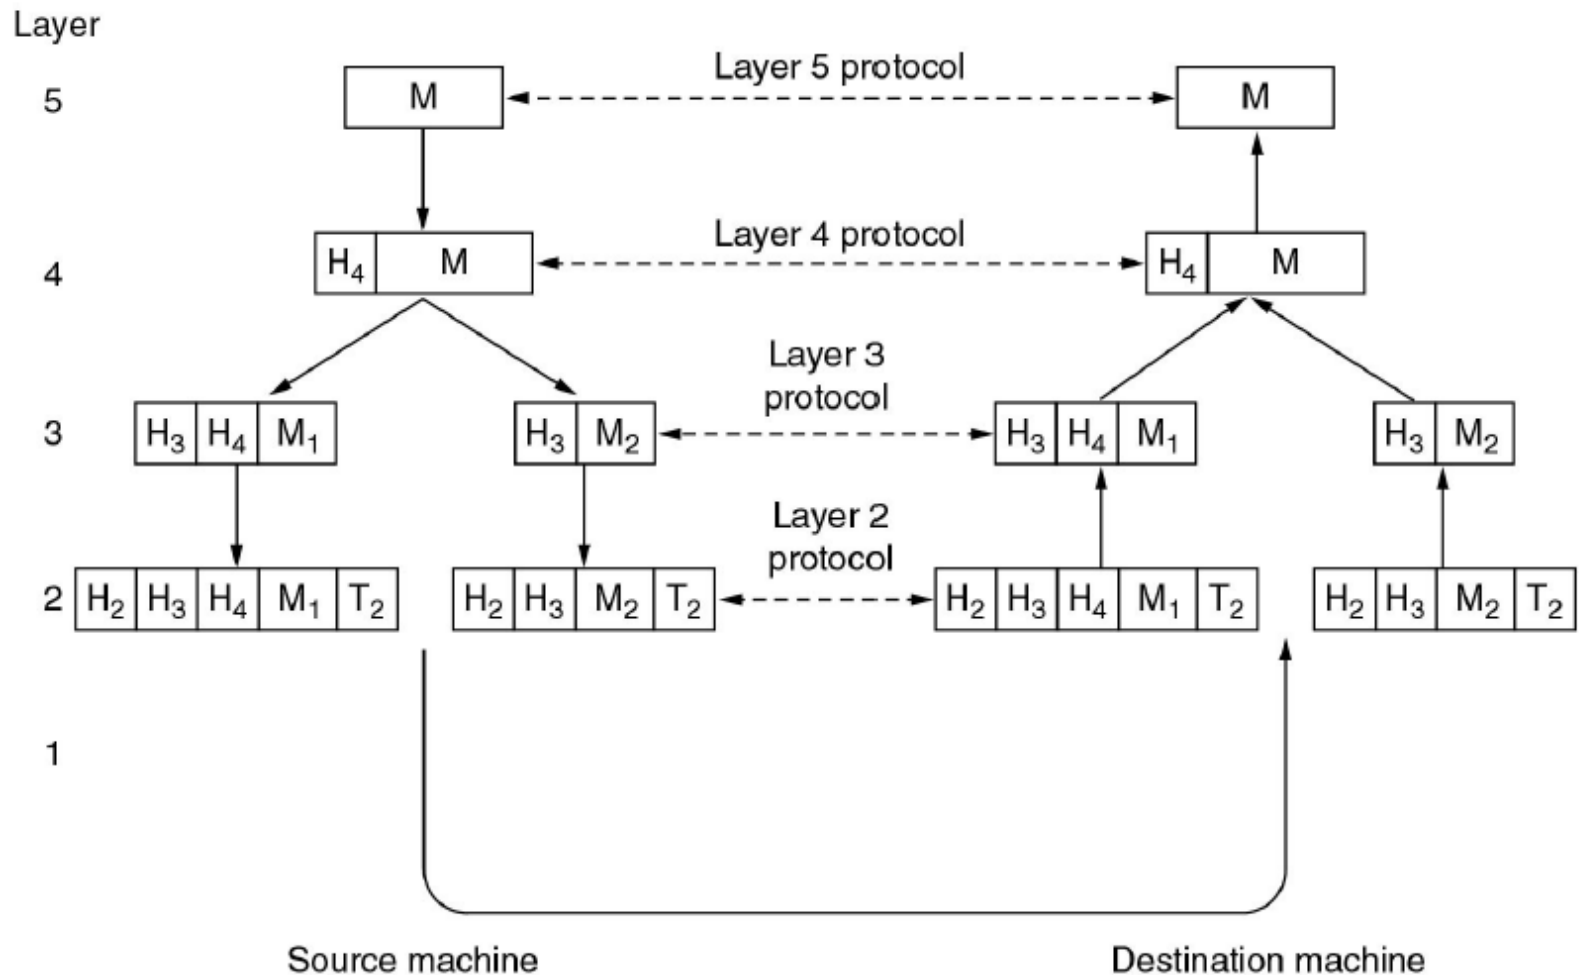

- ❖ explicit structure allows identification, relationship of complex system's pieces
  - layered *reference model* for discussion
- ❖ modularization eases maintenance, updating of system
  - change of implementation of layer's service transparent to rest of system
  - e.g., change in gate procedure doesn't affect rest of system
- ❖ layering considered harmful?

# Protocol Hierarchy..

The philosopher-translator-secretary architecture.

# Example information flow supporting virtual communication in layer 5.

# Internet protocol stack

- ❖ *application*: supporting network applications
  - FTP, SMTP, HTTP
- ❖ *transport*: process-process data transfer
  - TCP, UDP
- ❖ *network*: routing of datagrams from source to destination
  - IP, routing protocols
- ❖ *link*: data transfer between neighboring network elements
  - Ethernet, 802.111 (WiFi), PPP
- ❖ *physical*: bits “on the wire”

# ISO/OSI reference model

- ❖ ***presentation***: allow applications to interpret meaning of data, e.g., encryption, compression, machine-specific conventions
- ❖ ***session***: synchronization, checkpointing, recovery of data exchange
- ❖ Internet stack “missing” these layers!
  - these services, *if needed*, must be implemented in application
  - needed?

# Encapsulation

*source*

**switch**

*destination*

**router**

# What's the Internet: “nuts and bolts” view

- ❖ millions of connected computing devices:
  - *hosts* = *end systems*
  - running *network apps*

- ❖ *communication links*
  - fiber, copper, radio, satellite
  - transmission rate: *bandwidth*

- ❖ *Packet switches*: forward packets (chunks of data)
  - *routers* and *switches*

# “Fun” internet appliances

Web-enabled toaster +  
weather forecaster

Tweet-a-watt:  
monitor energy use

Internet  
refrigerator

Slingbox: watch,  
control cable TV remotely

Internet phones

# A closer look at network structure:

## ❖ *network edge:*

- hosts: clients and servers
- servers often in data centers

## ❖ *access networks, physical media:* wired, wireless communication links

## ❖ *network core:*

- interconnected routers
- network of networks
